

How to include a RIAA pre-amp inside your Airence Extender unit.

First you need to put the Extender unit upside down on a soft surface on its knobs and remove the bottom plate/frame and back panel.

This can be done by using a screw driver PZ 2 or Torx and unscrew the two bolts below the front panel, below the faders. Next are the two on the bottom of the frame and two on the side, one left and one right.

Now carefully remove the bottom frame and you can see all pcb's.

Now you can easily connect your RIAA pre-amp on one of the channels of the Extender unit.

Be careful that you connect the RIAA pre-amp correctly by putting the female and male connector header together.

Good luck
